"On 15 September 2022, Ethereum transitioned its consensus mechanism from proof-of-work (PoW) to proof-of-stake (PoS) in an update known as "The Merge", which cut the blockchain's energy usage by over 99%. History Founding (2013–2014) Ethereum was initially described in late 2013 in a white paper by Vitalik Buterin, a programmer and co-founder of Bitcoin Magazine, that described a way to build decentralized applications. Buterin argued to the Bitcoin Core developers that blockchain technology could benefit from other applications besides money and that it needed a more robust language for application development that could lead to attaching real-world assets, such as stocks and property, to the blockchain. In 2013, Buterin briefly worked with eToro CEO Yoni Assia on the Colored Coins project and drafted its white paper outlining additional use cases for blockchain technology. However, after failing to gain agreement on how the project should proceed, he proposed the development of a new platform with a more robust scripting language—a Turing-complete programming language—that would eventually become Ethereum. Ethereum was announced at the North American Bitcoin Conference in Miami, in January 2014."
