"Proposals exist to regulate smart contracts. Smart contracts are not legal agreements, but instead transactions which are executed automatically by a computer program or a transaction protocol, such as technological means for the automation of payment obligations such as by transferring cryptocurrencies or other tokens. Some scholars have argued that the imperative or declarative nature of programming languages would impact the legal validity of smart contracts. In some jurisdictions, legal scholars have examined how the rigidity of smart contracts interacts with traditional doctrines such as contractual unforeseeability. For instance, Colombian legal scholarship has proposed adapting the theory of supervening onerousness (teoría de la imprevisión) to account for the high economic and systemic costs of reversing smart contract effects through judicial intervention, emphasizing the need to internalize these costs and develop new procedural mechanisms for digital environments. Since the 2015 launch of the Ethereum blockchain, the term "smart contract" has been applied to general purpose computation that takes place on a blockchain."

"Role of Ripple Labs As Yale economist Gary Gorton notes, "Ripple and XRPL are not the same entity". Shortly after the XRPL was launched, McCaleb, Britto and Chris Larsen founded the company Open Coin in September 2012 to operate on the ledger. On September 26, 2013, OpenCoin officially changed its name to Ripple Labs, Inc and was at the time headed by Chris Larsen. Unlike many cryptocurrencies, XRP was pre-mined, with 100 billion tokens created at inception. The XRPL founders gifted 80 billion XRP, the platform's native currency, to Ripple Labs. Ripple Labs holds a portion of XRP and periodically releases tokens into circulation through sales, aiming to maintain market stability."
